

Endolift®

Advanced Non-Surgical
Skin Tightening Technology

What's Endolift®?

ENDOLIFT® IS A MINIMALLY INVASIVE OUTPATIENT LASER PROCEDURE USED IN ENDO-TISSUTAL (INTERSTITIAL) AESTHETIC MEDICINE.

The treatment has multiple purposes: the remodeling of both deep and superficial layers of the skin, toning, the retraction of connective septums and the stimulation of collagen production.

The main activity of **Endolift®** is promoting **skin tightening**, in other words the retraction and reduction of skin laxity thanks to the activation of neo-collagenesis and of metabolic functions in the extra cellular matrix.

The **skin tightening** created by **Endolift®** is strictly linked to the selectivity of the laser beam used, that is to the specific interaction of the laser light which selectively hits two of the main targets of the human body: water and fat.

Advantages

- ① Only one session.
- 🏥 Outpatient treatment.
- 🔪 No incisions.
- 🛌 No or minimum convalescence.
- 🛡️ Safe, visible and immediate results.
- 🕒 Long-term effect.
- 💉 Anesthesia is not necessary, air cooling system is sufficient.
- ⚙️ Possibility of therapeutic combination with several aesthetic treatments i.g. fractional non-ablative laser (LIGHTSCAN™).
